

# Bridging the Gap: Ending Food Deserts in Low-Income Communities

---

Michael Kenyon

July 15, 2025

## Thesis Statement:

Food deserts mainly affect low-income areas that include minority communities. These deserts make it hard for people to easily access healthy food, which can lead to many health problems which in turn can keep these areas stuck in poverty. To fix this we need to have better policies in place that focus more on local food access and allowing grocery stores to open up in these areas. Doing these changes helps people get more access to the nutritious food they deserve.

## Personal Connection:

This topic matters to me because access to nutritious food aligns with my core value of kindness, ensuring no one is left behind in the most basic human right: the right to eat well and live healthily.

# Supporting Points and Research

- **Systemic Inequity:** Structural racism and urban planning contribute to food deserts in Black and Brown communities.
- **Community-Based Solutions:** Local gardens, farmers' markets, and co-ops are effective grassroots responses to food inaccessibility.
- **Policy Intervention:** Government subsidies and zoning reforms are needed to bring permanent change and attract food retailers.

## Research Highlight:

"Food Deserts and the Causes of Nutritional Inequality" by Mari Gallagher shows that zip codes without grocery stores have significantly higher rates of obesity and diet-related illness.

(Gallagher, Mari. *Examining Food Deserts on Public Health*)

# Conclusion, Call to Action & Citations

## **Conclusion:**

Food deserts are a preventable outcome of systemic neglect. Through public policy, community empowerment, and food equity initiatives, we can ensure that all communities, regardless of income or race, have access to fresh, affordable food.

## **Call to Action:**

Support local food justice organizations, advocate for food equity legislation, and educate others about how food deserts impact health and opportunity.

# Why This Research Matters

---

- Gallagher's research shows how food deserts are directly linked to serious health problems like obesity and diabetes.
- People in these areas don't have the same food choices others do; it's not just about eating healthy, it's about whether healthy food is even available.
- This helped me understand that food deserts aren't just about food, they're about fairness, opportunity, and health.

# Real-World Solution in Action

---

- In Baltimore, an urban farm called Strength to Love II turned 1.5 acres of abandoned lots into fresh food sources.
- The project provides healthy produce and jobs to residents, helping the whole community.
- This is proof that local programs, with the right support, can make a big difference.
